

Big Heads, Lumps and Bumps: Hydrocephalus and Skull Lesions in the Pediatric Population

Mark M. Souweidane, M.D., F.A.A.P., F.A.C.S.
Professor and Vice Chairman
Department of Neurological Surgery
December 8th, 2010

Viscoelastic Properties of the Immature Cranium

- ▶ Open fontanelles and sutures allow cranial expansion
- ▶ High water content allow compensatory ventricular enlargement

Brain and Spine Center

Macrocephaly: Clinically Insignificant

- ▶ Constitutional macrocephaly
 - 5% of 'normal' children have an occipitofrontal circumference (OFC) greater than the 95 percentile
 - Nondivergent growth curve
- ▶ Increased subarachnoid spaces of infancy
 - External hydrocephalus
 - Divergent growth curve

Weill Cornell Medical College

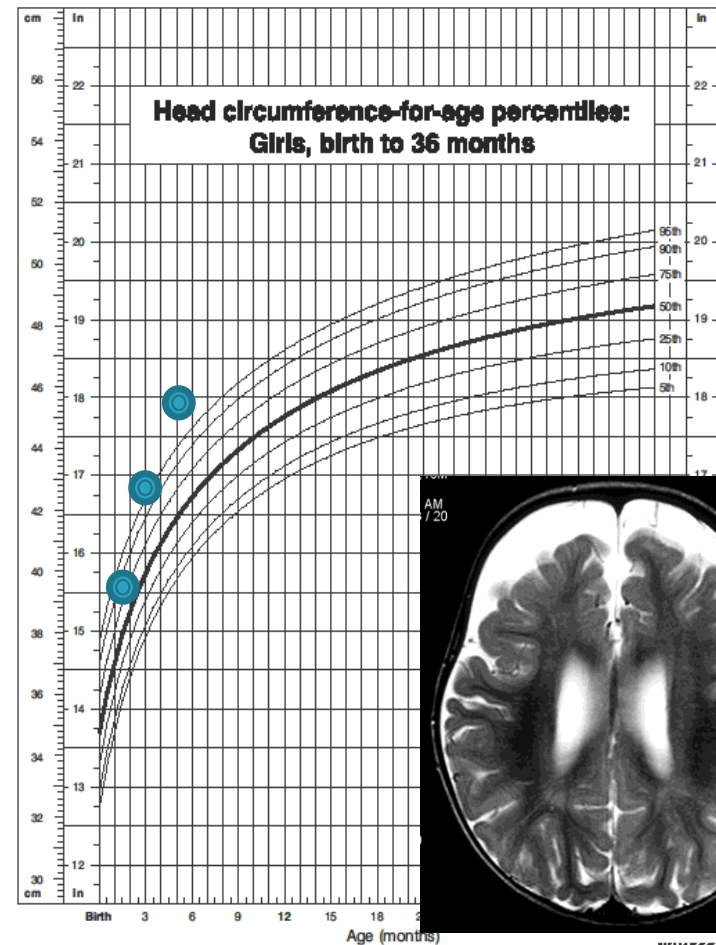

NewYork-Presbyterian
Phyllis and David Komansky
Center for Children's Health

Pediatric
Brain and Spine Center

Increased Subarachnoid Spaces of Infancy

- ▶ 6 month old female
- ▶ Normal birth and development history
- ▶ Growth curve as shown
- ▶ Open and full anterior fontanel
- ▶ No suture diastasis

CDC Growth Charts: United States

Macrocephaly: Clinically Significant

- ▶ Chronic subdural hematomas of infancy
 - Divergent growth curve
 - Usually nonaccidental trauma
- ▶ Hydrocephalus and other CSF circulation abnormalities
 - Divergent growth curve
- ▶ Neurodegenerative disorders (Canavans and Alexander disease)
 - Divergent growth curve

Center for Children's Health

Pediatric
Brain and Spine Center

Chronic Subdurals

- ▶ 6 month old female
- ▶ Normal birth and development history
- ▶ Growth curve as shown
- ▶ Open and full anterior fontanel
- ▶ Suture diastasis
- ▶ Irritability, vomiting, seizures, etc.

Alterations in CSF Circulation

- ▶ 6 month old female
- ▶ Normal birth and development history
- ▶ Growth curve as shown
- ▶ Open and full anterior fontanel
- ▶ Suture diastasis
- ▶ Irritability, vomiting, seizures, etc.
- ▶ Clinical manifestations of raised ICP
 - Frontal bossing
 - Forced down gaze
 - Engorgement of scalp veins

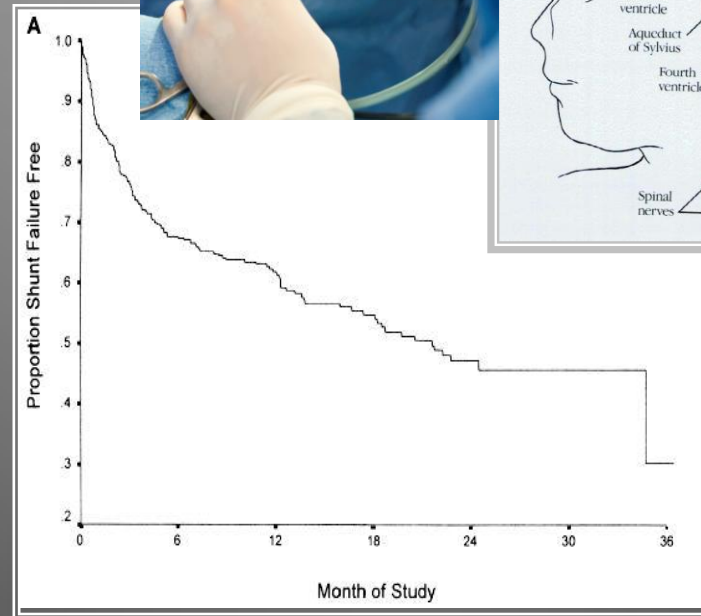

Published May 10, 2000.
SOURCE: Developed by the National Center for Health Statistics in collaboration with
the National Center for Chronic Disease Prevention and Health Promotion (2000).

SUPER-NUTRITION PROGRAM

Endoscopic Third Ventriculostomy

- ▶ Alternative to shunt placement
- ▶ Avoids all complications associated with shunts
- ▶ Restoration of normal CSF outflow and resorption
- ▶ Applicable in all forms of intraventricular obstructive hydrocephalus distal to the posterior third ventricle

Drake JM, Kestle JR, Milner R, et al: Randomized trial of cerebrospinal fluid shunt valve design in pediatric hydrocephalus. *Neurosurgery* 43:294-305, 1998.

Scalp and Skull Masses

- ▶ Posttraumatic
 - Cephalohematoma
 - Leptomeningeal cyst
- ▶ Neoplastic
 - neurofibroma
- ▶ Inflammatory
 - Lymphadenopathy
 - LCH
 - Cranial fasciitis
 - Infantile myofibromatosis
- ▶ Congenital
 - Inclusion cysts
 - Aplasia cutis congenita
- ▶ Vascular
 - Capillary hemangioma
 - Sinus pericranii
 - AV malformation
- ▶ Dysraphic
 - Cephaloceles
 - Atretic
 - Encephalocele
 - meningocele

Pediatric
Brain and Spine Center

Office Evaluation

▶ History

- Rate of growth
- History of trauma including birth history
- Fevers or associated illnesses

▶ Physical Examination

- Anatomical position (midline or eccentric, supratentorial or infratentorial)
- Pain on palpation
- Skin integrity
- Pulsatile
- Intracranial pressure transmission
- Associated lymphadenopathy

▶ Imaging decision

Scalp & Skull Masses

► Generalizations

- Malignancy is rare
- Intracranial extension is rare
- Diagnosis is seldom in question
- Heterogeneous pathology
 1. Inclusion cysts (dermoid cysts, epidermoid cysts)
 2. Langerhan's cell histiocytosis (eosinophilic granuloma)
 3. Cephaloceles
 4. Subperiosteal hematoma
 5. Leptomeningeal cyst

Center for Children's Health

Pediatric
Brain and Spine Center

Inclusion Cysts

- ▶ Congenital disorder
 - Failed dysjunction
- ▶ Epidermoid cyst
 - Intracranial
 - Older children/adults
 - Rare association with dermal sinus
- ▶ Dermoid cyst
 - Extracranial
 - Infants
 - Can be associated with dermal sinus (meningitides)

Weill Cornell Medical College

NewYork-Presbyterian
Phyllis and David Komansky
Center for Children's Health

Pediatric
Brain and Spine Center

Dermoid cyst

- ▶ Most common scalp mass evaluated by neurosurgeon (60%)
- ▶ Usually present at birth
- ▶ Epidermal and dermal elements
- ▶ Slow growth
 - Keratin
 - Cholesterol
 - Sebaceous

Weill Cornell Medical College

NewYork-Presbyterian
Phyllis and David Komansky
Center for Children's Health

Pediatric
Brain and Spine Center

Dermoid Cyst

- ▶ Anatomical location
 - Anterior fontanel
 - Rare dural penetration
 - Pterion
 - Suboccipital midline
 - Dermal sinus
 - Occipital sinus duplication
 - Dural penetration typical

NewYork-Presbyterian
Phyllis and David Komansky

Dermoid cyst

- ▶ Plain radiographs
 - Lytic
 - Smooth contours
 - Sclerotic margins

Weill Cornell Medical College

NewYork-Presbyterian
Phyllis and David Komansky
Center for Children's Health

Pediatric
Brain and Spine Center

Dermoid cyst: Treatment

- ▶ Elective surgical excision
- ▶ Split thickness autologous cranioplasty > infancy

Calvarial Dermoid Cysts

Langerhan's Cell Histiocytosis

- ▶ Histiocytosis X
 - Eosinophilic granuloma
 - Hand-Schuller-Christian Disease (diabetes insipidus, hypothalamic lesions)
 - Letterer-Siwe syndrome
- ▶ Uncertain etiology
 - Abnormal proliferation of histiocytes
- ▶ Skull is most common site
 - 28% polyostotic disease
 - Rarely intracranial
- ▶ Painful scalp mass
- ▶ Age 4–12 years

Weill Cornell Medical College

NewYork-Presbyterian
Phyllis and David Komansky
Center for Children's Health

Pediatric
Brain and Spine Center

Langerhan's Cell Histiocytosis

- ▶ Painful scalp mass
- ▶ Relatively short history
- ▶ Age 4–12 years
- ▶ Radiology
 - Plain films (“punched out”, no sclerotic margins, scalloped edges)
 - CT
 - External table remodeling
 - Diploic interspace

Weill Cornell Medical College

NewYork-Presbyterian
Phyllis and David Komansky
Center for Children's Health

Pediatric
Brain and Spine Center

Pediatric
Brain and Spine Center

Langerhan's Cell Histiocytosis

► Treatment

- Surgical
 - Curettage
 - Complete excision
- Adjunctive Rx
 - Radiation therapy
 - chemotherapy

Weill Cornell Medical College

NewYork-Presbyterian
Phyllis and David Komansky
Center for Children's Health

Pediatric
Brain and Spine Center

Langerhan's Cell Histiocytosis

- ▶ Outcome
 - Poorly defined
 - Local recurrence 6%
 - New recurrence 22%*
- ▶ Negative prognostic features
 - < 2 years age
 - Polyostotic disease
 - Hepatosplenomegaly
 - Thrombocytopenia

*Kilpatrick et al. Cancer 1995

Weill Cornell Medical College

Phyllis and David Komansky
Center for Children's Health

Pediatric
Brain and Spine Center

Cephalohematoma

- ▶ Subperiosteal hematoma resulting from birthing (prolonged labor, forceps delivery, etc.)
- ▶ Physical examination
 - Absent intracranial extension
 - Respects suture anatomy
- ▶ Treatment/Outcome
 - Spontaneous resolution, no need for treatment or aspiration
 - Minority of subperiosteal hematomas calcify
 - cephalohematoma deformans that may require recontouring

Leptomeningeal Cyst

- ▶ “Growing skull fracture”
- ▶ Rare sequelae of linear skull fractures in infants
- ▶ Herniation of leptomeninges and varying cerebral tissue
- ▶ Clinical Features
 - Delayed “swelling” following trauma
 - Progressive seizure disorder or neurological deficits
 - Plain X-ray is diagnostic (widely separated linear fracture)
- ▶ Repair directed at cranial defect

Weill Cornell Medical College

Cephaloceles

- ▶ Congenital disorders (encephaloceles, meningoceles) of nondysjunction
 - Skin
 - Calvarium
 - Meninges
 - Cerebrum
- ▶ Always midline (cranial base to craniocervical junction), transillumination
- ▶ Classification is varied
- ▶ Treatment is aimed at repair of defect
- ▶ Outcome dependent upon associated intracranial anomalies

Weill Cornell Medical College

NewYork-Presbyterian
Phyllis and David Komansky

Atretic Encephalocele

- ▶ “aborted” cephaloceles
- ▶ Congenital disorder, failed dysjunction
- ▶ Typically parietal-occipital
- ▶ Skin is atypical (discolored, attenuated, hypertrichosis)
- ▶ Associated structural cerebral anomalies
- ▶ Treatment aimed at normal skin covering
- ▶ Outcome dependent upon associated cerebral anomalies

Brain and Spine Center

Cranioplasty

- ▶ Spontaneous osteogenesis
 - Age dependent
- ▶ Autologous cranioplasty
 - Split thickness
- ▶ Synthetic cranioplasty
 - Acrylic
 - Titanium

Question:

- ▶ 6 month old female
- ▶ Normal birth and development history
- ▶ Growth curve as shown
- ▶ Open anterior fontanel
- ▶ Appropriate management includes:
 - a. Transfontanel sonogram
 - b. MRI of brain
 - c. Neurosurgical referral
 - d. Neurology referral
 - e. None of the above
