Brain and Spine Center

Murray Engel MD  
Jeffrey P Greenfield MD PhD

- ▶ 1. Orthopedic deformity, such as hip dislocation, contractures, or scoliosis
- ▶ 2. Impairment of activities of daily living (eg, dressing, bathing, toileting)
- ▶ 3. Impairment of mobility (eg, inability to walk, roll, sit)
- ▶ 4. Skin breakdown secondary to positioning difficulties and shearing pressure
- ▶ 5. Pain or abnormal sensory feedback
- ▶ 6. Poor weight gain secondary to high caloric expenditure
- ▶ 7. Sleep disturbance
- ▶ 8. Depression secondary to lack of functional independence

Weill Cornell Medical College

Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Motor disorder characterized by a velocity-dependent increase in muscle tone

1. Rigidity
2. Spasticity
3. Dystonia
4. Tremor
5. Clonus

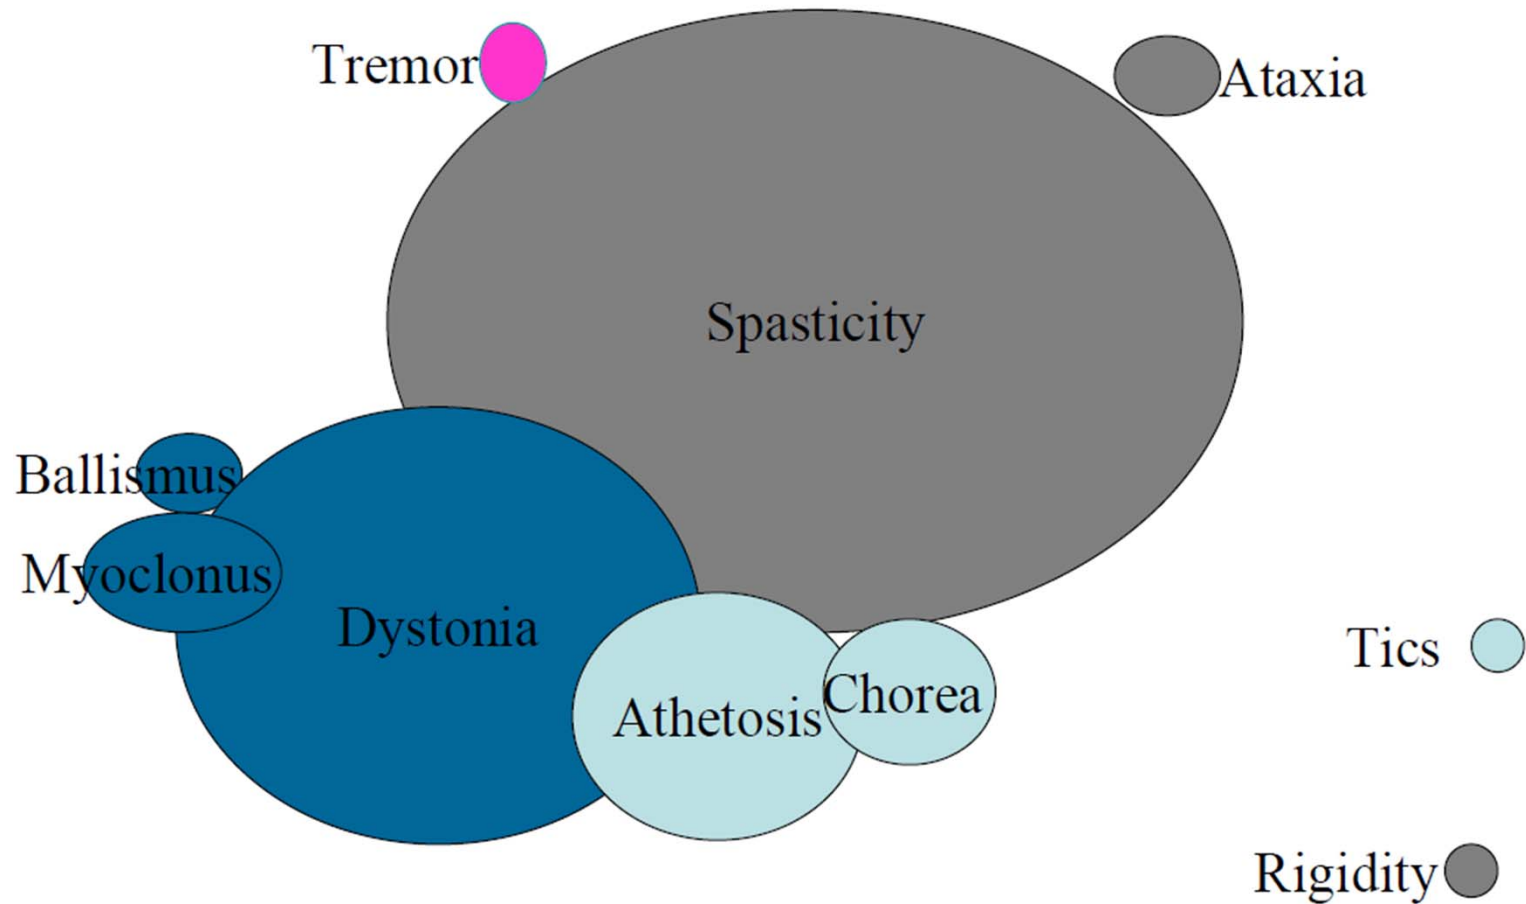

Weill Cornell Medical College

Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

# Spasticity may coexist with other conditions

Do not confuse with:

- ▶ 1. Rigidity – Involuntary, bidirectional, non-velocity-dependent resistance to movement
- ▶ 2. Clonus – Self-sustaining, oscillating movements secondary to hypertonicity
- ▶ 3. Dystonia – Involuntary, sustained contractions resulting in twisting, abnormal postures
- ▶ 4. Athetosis– Involuntary, irregular, confluent writhing movements
- ▶ 5. Chorea – Involuntary, abrupt, rapid, irregular, and unsustained movements
- ▶ 6. Ballism – Involuntary flinging movements of the limbs or body
- ▶ 7. Tremor – Involuntary, rhythmic, repetitive oscillations that are not self-sustaining

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

# Goals of spasticity management

1. To improve function related to the activities of daily living, mobility, the ease of care by caregivers, sleep, cosmesis, and overall functional independence
2. To prevent orthopedic deformity, the development of pressure areas, and the need for corrective surgery
3. To reduce pain
4. To allow the stretching of shortened muscles, the strengthening of antagonistic muscles, and the appropriate orthotic fit

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Lance: Motor disorder characterized by a velocity-dependent increase in tonic stretch reflexes (muscle tone) with exaggerated tendon jerks, resulting from hyperexcitability of the stretch reflex as one component of the upper motor neuron syndrome. (from Young, Spasticity: A review, Neurology, 44(Supp 9), Nov 1994, S12–20)

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Positive symptoms– exaggerated deep tendon reflexes, dystonia and contractures
- ▶ Negative symptoms–paresis and fatiguability
- ▶ Variations occur depending on which part of the CNS is damaged.
- ▶ Lesions just of corticospinal tract cause Babinski and paresis, without dystonia (internal capsule)
- ▶ Lesions of parasagittal perirolandic area(often traumatic) severely dystonic early on

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ “Group of disorders of movement and posture, causing activity limitation, that are attributed to nonprogressive disturbances that occurred in the developing fetal or infant brain. The motor disorders are often accompanied by disturbances of sensation ,cognition,communication,perception &/or behavior, &/or a seizure disorder.” Bax et al DMCM, 47(8):571–575,2005

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Prematurity: Periventricular Leukomalacia
- ▶ HIE(Hypothermia treatment)
- ▶ Intrauterine infections, chorioamnionitis
- ▶ Maternal coagulopathy– Pre or perinatal stroke and hemorrhage
- ▶ Development Brain Malformations
- ▶ Incidence 1.5 to 2.5 /1000 births(stable incidence due to greater neonatal survival)

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Hemiplegia– One arm and leg(stroke)
- ▶ Quadriplegic–Severe involvement all limbs (Severe HIE or brain malformations)
- ▶ Diplegic–Both legs primarily– often some arm involvement(PVL–premature)
- ▶ Dyskinetic–Chorea,athetosis,dystonia– Often with spasticity–Kernicterus,metabolic
- ▶ Ataxic(hypotonic)–Heterogeneous causes

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

# Evaluation of Tone: Clinical Rating Scales

- ▶ Modified Ashworth scale
  - 0 to 4 scale of tone intensity
- ▶ Oswestry scale
  - rates stage and distribution of tone
  - “useful” vs. “non-useful” movement
- ▶ Degree of adductor muscle tone (Snow)
- ▶ Tardieu scale
  - measures tone vs. velocity

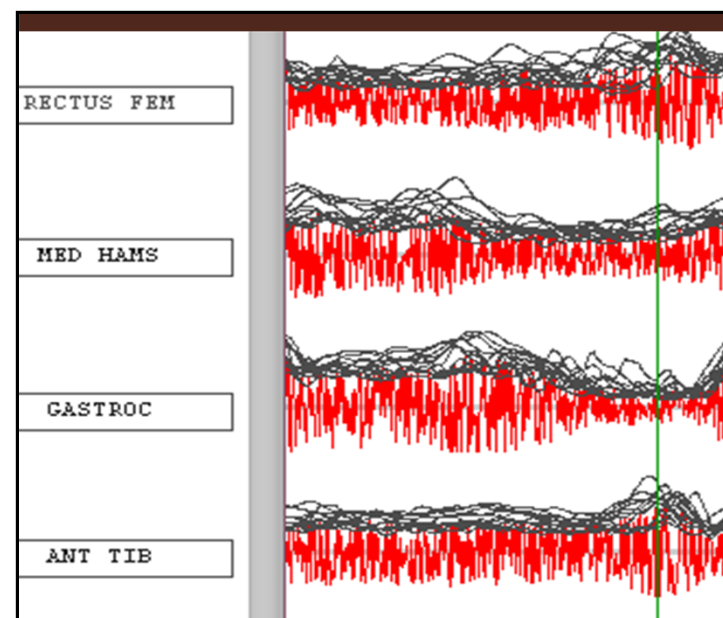

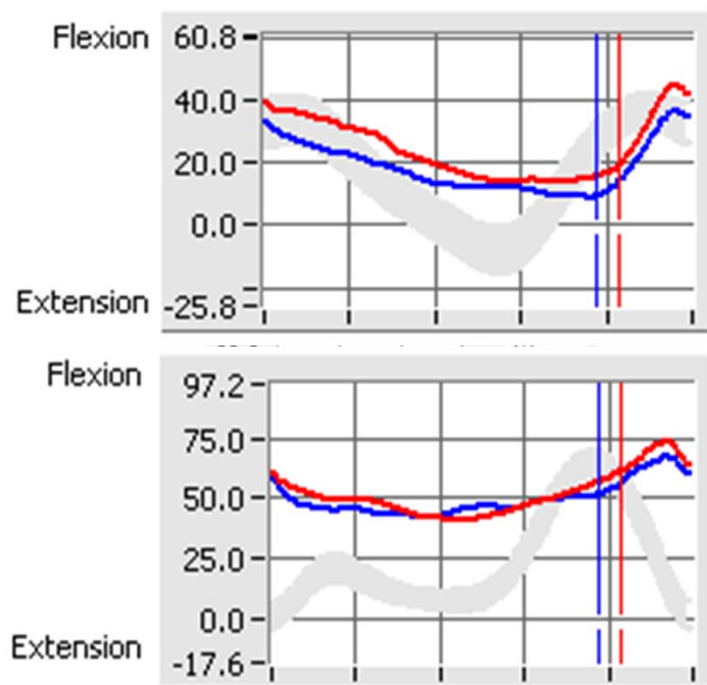

Weill Cornell Medical College

No meaningful plan can be formulated without first determining the goals of treatment including:

- ▶ patient/caregiver goals
- ▶ functional goals
- ▶ technical goals

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Increased ROM
- ▶ Decrease energy expenditure
- ▶ Decreased spasm frequency
- ▶ Decreased pain

- ▶ Improved mobility
- ▶ Improved gait
- ▶ Improved orthotic fit
- ▶ Improved positioning
- ▶ Increased ease of hygiene
- ▶ Improved cosmesis

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Neurologist
  - ▶ Physical Therapist and Occupational Therapist
  - ▶ Physiatrist
  - ▶ Orthopedic surgeon
  - ▶ Family and other caregivers
  - ▶ Coordinator/administrator
  - ▶ Wheelchair clinic, gait lab, orthotics clinic, counseling, social work
- 
- ▶ Neurosurgeon

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Rehabilitation
- ▶ Oral medication
- ▶ Intrathecal baclofen
- ▶ Chemodenervation
- ▶ Neurosurgery
- ▶ Orthopedic surgery

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Segmental Activity
- ▶ Alpha motor neuron
- ▶ 1a EPSPs
- ▶ 1a inhib interneuron
- ▶ Renshaw inhibition
- ▶ Presynaptic inhibition
- ▶ Polysynaptic paths
- ▶ Neurotransmitter
- ▶ Acetylcholine(Nicotin)
- ▶ Glutamate
- ▶ Glycine
- ▶ Glycine
- ▶ GABA
- ▶ Serotonin,TRH

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

# NEUROTRANSMITTER AGONISTS

- ▶ Neurotransmitter
- ▶ Acetylcholine–N
- ▶ Glutamate(EAA)
- ▶ Glycine
- ▶ GABA A receptor
- ▶ GABA B receptor
- ▶ Serotonin
- ▶ Agonist
- ▶ Nicotine
- ▶ NMDA,AMPA
- ▶ Threonine
- ▶ Benzos, Barbs
- ▶ Baclofen
- ▶ Buspirone, Imitrex

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

# NEUROTRANSMITTER ANTAGONISTS IN SPINAL CORD

- ▶ Neurotransmitter
  - ▶ Acetylcholine
  - ▶ Glycine
  - ▶ GABA A
  - ▶ GABA B
  - ▶ Serotonin
  - ▶ Opioids
  - ▶ ?Agmatine
- ▶ Antagonist
  - ▶ Trimethaphan
  - ▶ Strychnine
  - ▶ Picrotoxin
  - ▶ Baclofen
  - ▶ Tricyclics
  - ▶ Naloxone
  - ▶ Alpha adrenergic agonist (Clonidine, tizanidine)

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Different medications act at different locations in CNS; ?polypharmacy
- ▶ Side effect profile as important as benefits, especially in children eg sedation
- ▶ Will benefit also result in functional loss (Decreased spasticity but increased weakness)

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Structural analogue of GABA that inhibits mono and polysynaptic spinal reflexes
- ▶ Binds to GABA B receptor–Coupled to Ca & K channels, pre and postsynaptically
- ▶ Presynaptic membrane hyperpolarized & influx Ca restricted with decrease NT release in excitatory spinal path(decrease alpha motor neuron activity). Other effects (gamma inhibition,decrease muscle spindle activity).

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Studies most in spinal cord(MS)–spasms
- ▶ Benefit with decreased spasticity, spasms
- ▶ Side effects; Increased weakness, fatigue, attention and memory issues, seizures (also with sudden withdraw),elevated LFTs
- ▶ Half life 3.5 hours(may need 4/day)
- ▶ Up to 30– 60 mg in children(Gracies)

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Sustained or repetitive involuntary muscle contractions that produce abnormal but patterned postures and movements of different parts of the body(Fahn)
- ▶ Syndrome of sustained muscle contraction ,frequently causing twisting and repetitive movements or abnormal posture(Dystonia Foundation)

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ DYT1(DMD)–AD– Deletion 9q34 gene, Protein torsin–Deep brain stimulation of globus pallidus
- ▶ DYT5–Dopa–Responsive Dystonia–Segawa diurnal fluctuations, foot dystonia presents in childhood(mimic CP)–AD with marked phenotypic variability– 14q22.1–2, Protein GTP cyclohyrolase–Treated with Carbidopa 25/100mg

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Most common etiology associated with CP  
Also multiple genetic causes(eg Wilson's, glutaric aciduria), Stroke, Medication
- ▶ Carbidopa– At times partial response
- ▶ Anticholinergics
- ▶ Baclofen
- ▶ Botulinum

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Injectable therapy
- ▶ Results in local muscle weakening
- ▶ Temporary and titratable
- ▶ Agents include:
  - Botulinum toxin
  - Phenol
  - Ethyl alcohol

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Produced by the bacterium, *Clostridium botulinum*
- ▶ Seven serotypes (A–G); only “A” and “B” approved for clinical use
- ▶ Trade names of BTX–A:
  - BOTOX® (Allergan)
  - DYSPORT® (Ipsen, Ltd.)
- ▶ Conversion ratio: 1 Unit BOTOX~3–5 Units Dysport
- ▶ Trade name of BTX–B, from Elan:
  - Myobloc™ in USA
  - NeuroBloc® in Europe

Weill Cornell Medical College

NewYork-Presbyterian  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Injected directly into overactive muscle
- ▶ Focal, temporary chemodenervation
- ▶ Onset usually within 24–72 hours, maximum effect at approximately 2 weeks
- ▶ Clinical benefit usually >12 weeks; may be extended with adjunctive therapy
- ▶ Preliminary BTX-B results in spasticity indicate clinical efficacy; autonomic side effects in some patients

Weill Cornell Medical College

 **NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

Delivered via an implantable,  
programmable pump  
For management of severe spasticity  
due to:

- Cerebral palsy
- Stroke
- Brain injury
- Spinal cord injury
- Demyelinating disease

GABA<sub>b</sub> agonist

Decreases interneuronal  
firing at the spinal cord  
level

Oral dose of 60 mg  $\Rightarrow$  lumbar  
concentration of 24 $\mu$ g/L

Intrathecal infusion of 600  
 $\mu$ g/day  $\Rightarrow$  lumbar concentration  
of 1240 $\mu$ g/L

cervical concentration  
approximately 1/4th lumbar

Most patients maintained on  
300–800 $\mu$ g/day

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Pump controlled via radio-telemetry link from an external programmer
- ▶ Allows control of rate, mode, and pattern of infusion
- ▶ Dosage titration, schedule revision

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Indicated for patients with severe spasticity in whom oral medications have proven ineffective
- ▶ Age of 3–4 or older and at least 30–35 pounds
- ▶ Responsive to the trial dose
- ▶ Patient and family have commitment to program

Weill Cornell Medical College

 **NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Pump implanted in a subcutaneous or subfascial pouch in the abdomen just under the rib cage
- ▶ Catheter is placed in the lumbar spine (usually L3 or L4) with a 15 or 16 gauge Touhy needle
- ▶ Tip placement at the T10–T11 level is confirmed using fluoroscopy

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Dose adjustments performed in office using portable computerized programmer via a telemetry wand
  - Adjustable parameters include: drug concentration, reservoir status, alarms, infusion rate, and pattern,  
*e.g.*, more at night and less during school
- ▶ Dose may be increased by up to 15% on each occasion on a weekly basis
- ▶ Temporal adjustments for functional needs
- ▶ Adjustments in adjunctive therapies

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

Side effects are similar to oral medication and may be minimized by adjusting dose:

- ▶ Hypotonia
  - ▶ Somnolence
  - ▶ Nausea/vomiting
  - ▶ Headaches
  - ▶ Dizziness
- 
- ▶ Catheter and procedural complications
  - ▶ Infection
  - ▶ Overdose potential
    - Respiratory depression
    - Loss of consciousness
  - ▶ May be associated with a worsening of scoliosis in some patients

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Interruption of reflex arc
- ▶ Sectioning of afferent nerve rootlets  
L-2 to S-2
- ▶ EMG guidance, selected roots only

Treatment goals:

Improve gait and mobility; facilitate care; prevent contractures or bony deformities

Weill Cornell Medical College

**NewYork-Presbyterian**  
Phyllis and David Komansky  
Center for Children's Health

Pediatric  
Brain and Spine Center

- ▶ Pure spasticity
  - ▶ No evidence of dystonia (fluctuating tone) or rigidity (constant resistance to force)
  - ▶ No evidence of truncal hypotonia
  - ▶ Good head control
  - ▶ Best age is between 4 and 6
- 
- ▶ Spasticity of spinal cord origin
  - ▶ Athetosis
  - ▶ Rigidity
  - ▶ Poor trunk control
  - ▶ Severe weakness

Weill Cornell Medical College
